## Royal Statistical Society 2009 Conference Edinburgh, Scotland 7-11 September 2009

# Measuring Health Inequalities by an Approach Unaffected by the Overall Prevalence of an Outcome 

James P. Scanlan<br>Attorney at Law<br>Washington, DC, USA<br>jps@jpscanlan.com

## Subjects

1. The problem with standard binary measures of differences between outcome rates (relative differences, absolute differences, odds ratios):
that all exhibit patterns of correlation with overall prevalence (i.e., among other things, they tend to change as overall prevalence changes)
2. An alternative approach that avoids the problem with standard measures:
a measure that does not change as overall prevalence changes

# Patterns by Which Relative Differences Between Outcome Rates Tend to be Correlated with the Overall Prevalence of an Outcome - Scanlan's Rule 1 (aka Heuristic Rule X, Interpretive Rule 1) 

The rarer an outcome, the greater tends to be the relative difference in rates of experiencing it and the smaller tends to be the relative difference in rates of avoiding it.

Fig 1. Ratios of (1) Disadvantaged Group (DG) Fail Rate to Advantaged Group (AG) Fail Rate at Various Cutoff Points Defined by AG Fail Rate

Fig. 2. Ratios of (1) DG Fail Rate to AG Fail Rate and (2) AG Pass Rate to DG Pass Rate at Various Cutoff Points Defined by AG Fail Rate

## Patterns by Which Absolute Differences and Odds Ratios Tend to Change as the Overall Prevalence of an Outcome Changes - Scanlan's Rule 2

- As the overall prevalence of an outcome moves toward a range defined by a rate of $50 \%$ for one group (Point A) and 50\% for the other group (Point B), absolute differences tend to increase; as prevalence moves away from the range so defined, absolute differences tend to decrease; within the range, the patterns are somewhat more complicated. See Scanlan's Rule page on jpscanlan.com.

Odds ratios tend to change in the opposite direction of absolute differences.

## Fig 4. Ratios of DG Failure Odds to AG Failure Odds at Various Cutoff Points Defined by AG Fail Rate

## Fig. 5: Ratios of (1) DG Fail Rate to AG Fail Rate, (2) AG Pass Rate to DG Pass Rate, (3) DG Failure Odds to AG Failure Odds; and (4) Absolute Difference Between Rates

- (1) DG Fail Rate/AG Fail Rate - (2) AG Pass Rate/DG Pass Rate -(3) DG Fail Odds/AG Fail Odds

Fig. 6. Ratios of (1) Black to White Rates of Falling Below Percentages of Poverty Line, (2) White to Black Rates of Falling Above the Percentage, (3) Black to White Odds of Falling Below the Percentage: and (4)Absolute Differences Between Rates

Fig. 7. Ratios of (1) Black to White Rates of Falling Above Various Systolic Blood Pressure Levels, (2) White to Black Rates of Falling below the Level, (3) Black to White Odds of Falling Above the Level; and (4) Absolute Difference Between Rates (NHANES 1999-2000, 2001-2002, Men 45-64)

## Solution: Estimated Effect Size (EES)

Difference between means of hypothesized underlying normal distributions of risks of experiencing an outcome, in terms of percentage of a standard deviation, derived from any pair of outcome rates.

Table 1. Illustration of Meaning of Various Ratios at Different Prevalence Levels

| Ratio | DGFailRate | AGFailRate | EES |
| ---: | ---: | ---: | ---: |
| 1.2 | $60.0 \%$ | $50.0 \%$ | 0.26 |
| 1.2 | $18.4 \%$ | $15.4 \%$ | 0.12 |
| 1.5 | $75.0 \%$ | $50.0 \%$ | 0.68 |
| 1.5 | $45.0 \%$ | $30.0 \%$ | 0.39 |
| 2.0 | $40.0 \%$ | $20.0 \%$ | 0.59 |
| 2.0 | $20.0 \%$ | $10.0 \%$ | 0.44 |
| 2.0 | $1.0 \%$ | $0.5 \%$ | 0.24 |
| 2.5 | $24.2 \%$ | $9.7 \%$ | 0.60 |
| 2.5 | $7.4 \%$ | $2.9 \%$ | 0.44 |
| 3.0 | $44.0 \%$ | $14.7 \%$ | 0.90 |
| 3.0 | $14.4 \%$ | $4.8 \%$ | 0.60 |
| 3.0 | $2.7 \%$ | $0.9 \%$ | 0.44 |

## Table 2. Illustration of UK Changes Over Time from Table 4.13 of The Widening Gap (rates per 100,000)

| Cohort | Year | Class I | Class V | Mort Ratio | Survival Ratio | AbsDf | EES |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 55-64 | 1921 | 2247 | 3061 | 1.36 | 1.008397 | 814 | 0.14 |
| 55-64 | 1931 | 2237 | 2535 | 1.13 | 1.003058 | 298 | 0.06 |
| 55-64 | 1951 | 2257 | 2523 | 1.12 | 1.002729 | 266 | 0.05 |
| 55-64 | 1961 | 1699 | 2912 | 1.71 | 1.012494 | 1213 | 0.25 |
| 55-64 | 1971 | 1736 | 2755 | 1.59 | 1.010479 | 1019 | 0.21 |
| 55-64 | 1981 | 1267 | 2728 | 2.15 | 1.015020 | 1461 | 0.32 |
| 55-64 | 1991 | 953 | 2484 | 2.61 | 1.015700 | 1531 | 0.39 |

## Table 3. Illustration of UK Differences across Age Groups from Table 4.13 of The Widening Gap

| Year | Cohort | Class I | Class V | Mort <br> Ratio | Survival <br> Ratio | AbsDf | EES |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| 1991 | $25-34$ |  |  |  |  |  |  |
|  |  | 39 | 187 | 4.8 | 1.001483 | 148 | 0.47 |
| 1991 | $35-44$ | 101 |  | 382 |  |  |  |
| 1991 | $45-54$ | 306 |  |  |  |  |  |
| 1991 | $55-64$ |  |  |  |  |  |  |

Table 4. Illustration of Comparisons as to Different Conditions from Lawlor (AJPH 2006) (Aberdeen 1950 birth cohort) (rates are per 10,000) (see D28)

| Cond | Class I | Class V | Adv <br> Ratio | Fav <br> Ratio | AbsDf | EES |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| CHD | 8.30 | 20.50 | 2.5 | 1.001223 | 12.2 | 0.28 |
| Stroke | 2.30 | 7.80 | 3.4 | 1.000550 | 5.5 | 0.34 |

Table 5. Illustration of Age Group Comparisons in Whitehall Studies from Marang-van de Mheen (JECH 2001) (rates are per 1,000 )

| Age | HGMR | LGMR | MortRatio | SurvRatio | AbsDf | EES |
| :---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $55-59$ | 6.80 | 13.90 | 2.05 | 1.0072001 | 7.1 | 0.27 |
| $60-64$ | 11.30 | 19.90 | 1.76 | 1.0087746 | 8.6 | 0.22 |
| $65-69$ | 17.50 | 28.10 | 1.61 | 1.0109065 | 10.6 | 0.20 |
| $70-74$ | 30.90 | 47.50 | 1.54 | 1.0174278 | 16.6 | 0.20 |
| $75-79$ | 50.60 | 70.00 | 1.38 | 1.0208602 | 19.4 | 0.16 |
| $80-84$ | 78.30 | 107.60 | 1.38 | 1.0328328 | 29.3 | 0.19 |
| $85-89$ | 144.30 | 181.60 | 1.26 | 1.0455767 | 37.3 | 0.16 |

Table 6. Illustration Based on Boström and Rosén (SJPH 2003) Data on Mortality by Occupation in Seven European Countries (see D43 caveat)

| Country | EES 1980-84 | EES 1990-94 |
| :--- | ---: | ---: |
| Denmark | 0.14 | 0.13 |
| England and Wales | 0.11 | 0.15 |
| Finland | 0.16 | 0.23 |
| Ireland | 0.10 | 0.19 |
| Norway | 0.12 | 0.16 |
| Spain | 0.12 | 0.23 |
| Sweden | 0.14 | 0.17 |

## Problems with the Solution

- Always practical issues (we do not really know the shape of the underlying distributions)
- Sometimes fundamental issues (e.g., where we know distributions are not normal because they are truncated portions of larger distributions, see D43 on MHD); cf. BSPS 2007, Fig. 6
- Irreducible minimum issues (A10, B7 (BSPS 2006), D63, D43, Irreducible Minimums Issue page on MHD)

## Conclusion

- If we are mindful of the problems, the approach provides a framework for cautiously appraising the sizes of differences between outcome rates.
- Regardless of problems, the approach is superior to reliance on standard binary measures of differences between rates without regard to the way those measures tend to be correlated with the overall prevalence of an outcome.
